

Bachelor in Physics

(Academic Year 2026-27)

Differential Geometry and Tensor Calculus		Code	800522	Year	3rd	Sem.	2nd
Module	Transversal	Topic	Transversal topics		Character	Optional	

	Total	Theory	Exercises
ECTS Credits	6	4	2
Semester hours	45	30	15

Learning Objectives (according to the Degree's Verification Document)
• Acquire skills in different transversal subjects to be able to apply them in fourth-year courses. • Develop the ability to apply the concepts and methods of differential geometry and tensor calculus to problems of classical and quantum physics.
Brief description of contents
Differential geometry, tensor calculus and their applications to physics.
Prerequisites
Algebra, calculus of one and several variables, and differential equations.

Coordinator	Francisco Navarro Lérída			Dept.	FT
	Office	03.306.B	e-mail	fnavarro@fis.ucm.es

Syllabus	
1. Theory of curves	The concept of a curve. Arc length. Curvature and torsion. Formulas of Frenet.
2. Surfaces: first fundamental form and tensor calculus	The concept of a surface. Curves on a surface. First fundamental form. The concept of Riemannian geometry. Covariant and contravariant vectors. Foundations of tensor calculus. Special tensors.
3. Surfaces: second fundamental form, gaussian and mean curvature	Second fundamental form. Principal curvatures, mean and Gaussian curvature. Formulas of Weingarten and Gauss. Properties of the Christoffel symbols. The Riemann curvature tensor. Theorema egregium (Gauss).
4. Geodesic curvature and geodesics	Geodesic curvature. Geodesics. Arcs of minimum length: introduction to the calculus of variations. Theorem of Gauss-Bonnet.
5. Covariant differentiation and parallel transport	Covariant differentiation. The Ricci identity. The Bianchi identities. Parallel transport.

Online Resources
Virtual Campus.

Methodology
The following learning activities will be developed: - Theory lessons, in which the fundamental concepts of the subject will be explained and illustrated with examples and applications. - Practical problem-solving sessions. The theory lessons and problem-solving sessions will take place mainly on the blackboard, although they may be supplemented with computer projections. The teacher will assist the students at the specified office hours in order to solve doubts or expand concepts. A collection of problems will be made available to students in the Virtual Campus prior to their resolution in class.

Evaluation Criteria		
Exams	Weight:	70%
Final mark for the Exams section, N_{Exam}, between 0 and 10. Mark obtained in the final exam, which will consist of theoretical questions and problems of similar difficulty to those solved in class.		
Other Activities	Weight:	30%
Exercises handed in throughout the course or carried out during classes, or exams covering part of the		

syllabus.

The final mark for this section will be $N_{\text{OtherActiv}}$ and will range from 0 to 10.

Final Mark

Final mark:

$$C_{\text{Final}} = \max \{ 0.7N_{\text{Exam}} + 0.3N_{\text{OtherActiv}}, N_{\text{Exam}} \}$$

Minimum final exam mark for weighting: $N_{\text{Exam}} \geq 4.5$

The final mark criterion, as well as the mark corresponding to other activities, will be maintained in the exam of the extraordinary call.
